AC compressor for Commercial Vehicles – febi supplies OE matching quality

On hot summer days air conditioning systems provide cool cabin temperatures which contribute to driver safety. In high temperatures conditions the concentration of the driver may be impaired significantly which can in turn increase the risk of an accident.

Vehicle air conditioning systems lose an average of 8% of the refrigerant per year through hoses, O-rings and dynamic oil seals on the compressor. When the cooling capacity of the air conditioning decreases, maintenance is required. The refrigerant and the oil level in the system must be checked and refilled if necessary in order to prevent damage to the compressor due to lack of lubrication and to ensure efficient cooling performance.

With 38 different air compressor references, febi already covers more than 90% of models from the big seven commercial vehicle manufacturers, Mercedes-Benz, MAN, Volvo Trucks, Scania, Renault Trucks, DAF Trucks and Iveco.
