Ball Joint with Additional Parts

When the original ball joint needs to be replaced either as a result of wear or damage, febi offers a repair kit – 22265 – which includes the ball joint and fixing kit (incl. 3 collar bolts and self-locking nuts).

The original ball joint is secured to the lower suspension arm via rivets. These require careful removal with a drill before fitting the new joint. This repair can be completed without removing and replacing the suspension arms which saves time for an efficient repair.
